

## TITLE: Conductors and Non-conductors

The purpose of this lab is

- Observe conductivity in a variety of substances
- Observe the difference of conductivity in strong, weak, and non-electrolytes using an LED lightbulb and battery
- Observe the reactivity of compounds with different conductivities.
- Observe how different states of matter effect the conductivity of ionic compounds
- 

### Reference:

### Observations and Data:

#### Demo One: Melting Salt $\text{KClO}_3$

- ❖  $\text{KClO}_4$  – potassium chlorate
  - Conductivity as a solid salt: non-conductive. Ions not mobile.
  - Conductivity as a molten salt: conductive. Ions mobile  $\text{K}^+$ .....
- ❖ Orange flame due to burning potassium chlorate

Figure 1. Apparatus for melting  $\text{KClO}_4$

**Conclusion:** Mobile ions are needed for conductivity. Liquid ionic salts conduct while ionic solids do not.

#### **Demo Two: Reaction of $\text{H}_2\text{SO}_4(\text{aq})$ and $\text{Ba}(\text{OH})_2(\text{aq})$**

- ❖  $\text{H}_2\text{SO}_4(\text{aq})$  -sulfuric acid - strong acid
- ❖  $\text{Ba}(\text{OH})_2(\text{aq})$  - barium hydroxide - strong base
- ❖ Mixture turned a dark pink and cloudy – precipitate forming
- ❖ Over time the conductivity decreased
- ❖ Mixture turned fully white

- ❖ Conductivity climbs back up as mixture becomes acidic
- ❖ Neutralization of the acid with a base

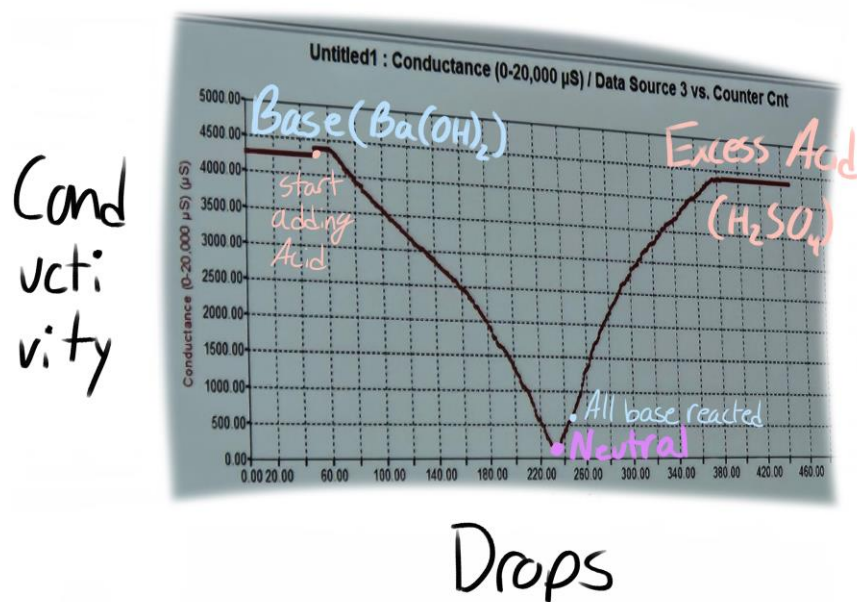

Figure 2. Graph of conductivity of reaction of  $\text{H}_2\text{SO}_4(\text{aq})$  and  $\text{Ba}(\text{OH})_2(\text{aq})$

Figure 3. Apparatus for reaction of  $\text{H}_2\text{SO}_4(\text{aq})$  and  $\text{Ba}(\text{OH})_2(\text{aq})$

**Conclusion:** Insoluble salts are not conductive even if the reactant that create them are.

### Experiment Three: Ionic and Covalent Substances

| Substance/Solution | Observations | Strong, weak, or non-conductor | Covalent/Ionic and ionization |
|--------------------|--------------|--------------------------------|-------------------------------|
|--------------------|--------------|--------------------------------|-------------------------------|

|                                |                               |                  |  |
|--------------------------------|-------------------------------|------------------|--|
| Deionized water                | Weak light<br>(contamination) | Non-conductor    | Covalent and not ionized<br>(H <sub>2</sub> O)   |
| 0.5M acetic acid               | Weak acid<br>Weak light       | Weak conductor   | Covalent and slightly<br>ionized<br>(CH <sub>3</sub> COO <sup>-</sup> + H <sup>+</sup> ) |
| 17.4M acetic acid              | No light                      | Non-conductor    | Covalent and no ionized<br>(CH <sub>3</sub> COOH)  |
| 6M HCl                         | Strong acid<br>Strong light   | Strong conductor | Covalent and 100%<br>ionized<br>(H <sup>+</sup> Cl <sup>-</sup> H <sub>2</sub> O)        |
| Aqueous NaCl                   | Strong light                  | Strong conductor | Ionic and soluble<br>(Na <sup>+</sup> Cl <sup>-</sup> H <sub>2</sub> O)                  |
| 95% ethyl alcohol<br>(ethanol) | No light                      | Non-conductor    | Covalent and not ionized<br>(H <sub>2</sub> O CH <sub>3</sub> CH <sub>2</sub> OH)        |

- ❖ 17.4M acetic acid is less acidic than 0.5M acetic acid because it is oversaturated. Not enough water to break it apart into ions.

## Experiment Four: Conductivity and Reactivity of Strong and Weak Acids

H<sub>2</sub>CO<sub>3</sub> = H<sub>2</sub>O CO<sub>2</sub>

- ☐ Marble chips of CaCO<sub>3</sub> are white stone.
  - ☐ Gas started forming immediately after adding HCl.
  - ☐ No reaction with acetic acid
- ☐ Mossy zinc is a streaky grey metallic solid.
  - ☐ Gas started forming immediately after adding HCl. More bubbling than reaction of HCl and CaCO<sub>3</sub>
  - ☐ No reaction to acetic acid

| Acid  | Reactant          | Conductivity of acid  | Reactivity       | Reaction equation   |
|---|-------------------|-----------------------|------------------|---|
| 6M HCl                                      | CaCO <sub>3</sub> | Yes, strong conductor | Yes, gas bubbles | 2HCl(aq) + CaCO <sub>3</sub> (s) → H <sub>2</sub> CO <sub>3</sub> + CaCl <sub>2</sub> |
| 6M HCl                                      | Zn                | Yes, strong conductor | Yes, gas bubbles | 2HCl(aq) + Zn(s) → H <sub>2</sub> (g) + ZnCl <sub>2</sub> (aq)                        |
| 17.4M acetic acid<br>(CH <sub>3</sub> COOH) | CaCO <sub>3</sub> | No, non-conductor     | No               | N/A   |
| 17.4M acetic acid<br>(CH <sub>3</sub> COOH) | Zn                | No, non-conductor     | No               | N/A   |

**Figure 4. Reactions**

**Conclusion:** Conductors react with metals while non-conductors do not. There is a correlation between the conductivity of a solution and its reactivity.

### Experiment Five: Conductivity and Ionic Reactions

| Experiment | Solution/Mixture                | Observation  | Conductivity | Reaction Equations  |
|------------|---------------------------------|--------------|--------------|---|
| 5a         | 0.1M HCl                        | Strong light | High         | $H^+(aq) + Cl^-(aq)$  |
|            | 0.1M NaOH                       | Strong light | High         | $Na^+(aq) + OH^-(aq)$   |
|            | 0.1M HCl +<br>0.1M NaOH         | Strong light | High         | Molecular:<br>$HCl(aq) + NaOH(aq) \rightarrow H_2O(l) + NaCl(aq)$<br><br>Ionic:<br>$H^+(aq) + Cl^-(aq) + Na^+(aq) + OH^-(aq) \rightarrow Cl^-(aq) + Na^+(aq) + H_2O(l)$<br><br>Net Ionic:<br>$H^+(aq) + OH^-(aq) \rightarrow H_2O(l)$ |
| 5b         | 0.1M $CH_3COOH$                 | Weak light   | Low          | $CH_3COO^- + H^+$   |
|            | 0.1M $NH_3$                     | Weak light   | Low          | $N^{3-} + 3H^+$   |
|            | 0.1 $CH_3COOH$ +<br>0.1M $NH_3$ | Strong Light | High         | Molecular:<br>$CH_3COOH(aq) + NH_3(aq) \rightarrow NH_4CH_3OO(aq)$<br>Ionic:<br>$CH_3COO^-(aq) + H^+(aq) + (aq) \rightarrow NH_4^+(aq) + CH_3OO^-(aq)$<br><br>Net Ionic:<br>Same as ionic, no spectator ions                          |

**Conclusion:** The conductivity of reactants does not correlate with the conductivity of the products. Weak conductor reactants can create a strong conductor product, the conductivity could remain unchanged, etc.
